FARM EMPLOYMENT UNDER LAST YEAR
WAGE RATES HIGHER

About 9.3 million people were at work on farms during the week of June 19-25, the Crop Reporting Board reported today. Of this total, 6.8 million were operators and unpaid members of their families and 2.5 million were hired workers. The number of family workers was 2 percent less than a year earlier and the number of hired workers was 6 percent less.

In comparison with a month earlier, the number of family workers was down 2 percent while the number of hired workers was up about a fourth or about a half million. Both changes were about usual for the season.

Farm wage rates on about July 1 averaged 1 percent more than a year earlier for the country as a whole. The seasonally adjusted index of farm wage rates was 510 percent of the 1910-14 average compared with 505 July 1, 1954. All types of rates for the Nation were higher than a year ago. Monthly rates were up \$3.00, weekly rates about \$1.00, daily rates 10 cents, and hourly rates 1 cent.

On a regional basis, wage rates averaged higher than a year ago in all regions except the West North Central. Increases varied from 1 percent to 4 percent with the largest increase in the New England States. Increases in industrial wage rates probably had the greatest effect in this area. Individual rates were also all higher than a year earlier except in the West North Central States and in a few cases where individual rates held steady. In the West North Central States, the monthly rate with house, and the daily rate without board or room were under a year earlier while the hourly rate without board or room remained the same. Rather slow progress of winter wheat harvest may account for the failure of wage rates to increase in this region as they did in other regions.

Individual types of wage rates for the country as a whole were up from April 1 but not as much as usual as indicated by the drop of 1 percent in the seasonally adjusted index. The index indicates that by regions, changes from April 1 were mixed. The index was down in the Middle Atlantic, East and West North Central, and South Atlantic States, up in the New England, East and

West South Central States, and about the same in the Mountain and Pacific States. The largest changes were the increase in the New England States and the decrease in the West North Central States. Changes in other regions were about 1 percent or less.

For individual types of rates, practically all rates in all regions were up seasonally except in the South Atlantic States. In this region, all individual rates were lower than the previous quarter. A decrease in individual types of rates is usual for the season in this region, but the decrease in the seasonally adjusted index indicates a little greater than usual drop this year. Wage rates in this region are probably influenced by large numbers of children out of school working for lower rates than persons available about April 1.

Weather during the week of June 19-25 was generally favorable for farm work. Temperatures were a little above normal in the Mountain States and slightly below normal in the rest of the country. Rain in the form of scattered showers was light in most of the country. Moderate to heavy rains hit the Atlantic Coast, eastern Texas, and a narrow belt from Eastern Wyoming to Tennessee.

Farm work during the survey week consisted largely of cultivation of row crops and harvest of small grains and hays. Cultivation of crops was in progress practically everywhere. In some areas of the South, crops had been "laid by." Small grain harvest was completed in much of the South and was starting in the North Central States. Winter wheat harvest was completed in Texas except in the High Plains area and was well along in Kansas. In Kansas, cloudy weather, uneven ripening, and weeds were slowing harvest slightly. Very little combining was done in the western part of the State. Supplies of men and equipment were adequate.

Most planting was completed before the end of June. However, in parts of the South, soybeans and grain sorghums were being planted after small grains had been harvested.

Besides the major operations of harvesting small grains and hay, farmers were harvesting a variety of other crops in many different areas. Fruits and vegetables of various kinds were probably the most important. Tobacco was being harvested in the southern part of the Tobacco Belt. In Texas, grain sorghums were being harvested in the south, and cotton was being picked in the Lower Valley.

Decreases from a year ago in the total number of persons working on farms during the survey week ranged from 1 percent to 6 percent. In most cases, the numbers of family workers and of hired workers were each less than a year earlier. In the New England States there were a few more hired workers than a year earlier. In the Pacific States, there were a few more family workers than a year earlier, while in the West South Central States there was no change in the number of family workers. A 15-percent decrease in the West North Central States in hired workers was probably largely due to a change from last year in the progress of wheat harvest in Kansas and Nebraska.

The usual pattern of change from May to June in the numbers of family workers was followed this year. There are usually increases in the New England and Middle Atlantic States where field work starts late, little change in the East North Central, East South Central, and the Pacific States, and decreases elsewhere.

For hired workers, the usual increases from May to June range from 40 percent to 60 percent in the Middle Atlantic, East and West North Central, and South Atlantic States. This year, increases were greater than usual in all these regions except the West North Central. Seasonal increases are usually moderate in the East South Central, Mountain, and Pacific States. They were that this year with a larger than usual rise in the Mountain States and an increase of less than average size in the Pacific States. There was a small increase of about the usual proportion in the New England States. In the West South Central States where there is usually little change the number of hired workers was 12 percent less than a month earlier. The decrease is partly the result of the more than usual increase a month earlier.

The total number of persons at work on farms was up 5 percent to 9 percent from late May to June in five of nine regions. In the Middle Atlantic States there were 16 percent more persons at work than a month earlier, about the usual rise. In the East South Central and the Mountain, there were the usual very small increases, while in the West South Central States there were fewer persons at work than a month earlier. The decrease was greater than usual.

1/ Certain wage rates are not estimated because they are relatively unimportant.
2/ Adjusted for seasonal variation.

OFFICIAL BUSINESS

EXPLANATIONS 1/

Farm employment estimates of the Agricultural Marketing Service cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms during the last complete calendar week ending at least one day before the end of the month. The Census of Agriculture and interview surveys of farmers are used to provide bench mark data on employment.

All farm operators who spend one hour or more during the survey week at farm work, chores, or in the transaction of farm business are counted as employed. Members of the operator's family or household doing unpaid farm work or chores, are counted if they put in 15 hours or more during the week. Operators plus unpaid members of their families or households who meet these criteria are called family workers. All persons doing one or more hours of farm work or chores for pay during the week are counted as hired workers.

The data on farm employment published by the Agricultural Marketing Service differ from those on agricultural employment of the Census in the Monthly Report on the Labor Force because of the differences in the method of approach, in concepts of employment, and in time of the month for which data are collected. The AMS collects information from the farmer on all persons working on his farm during the week regardless of age or other jobs held by these workers. The Census data are obtained by interview from about 22,000 farm and nonfarm households on the labor force status of the household members, 14 years of age and over, for the week including the 8th of the month. In addition, both series are subject to sampling variation and may differ from the results of a complete census.

Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality.

1/ Additional information available in January 1955 issue of Farm Labor.
